Novel isolated native PRO polypeptide useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis, Usher syndrome.

Example 33; Page 96; 469pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for Inking a bloactive molecule to a cell expressing a PRO polypeptide, for Inking a conscience molecule to a cell expressing a PRO polypeptides are useful for catecting other PRO polypeptides in a sample and for linking a conscience molecule to a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides. PRO polypeptides are also useful conflict antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. PRO polypeptides are also useful conflictestinal mucosa and the repair of acute and chronic mucosal of gastrointestinal mucosa and the repair of acute and chronic mucosal conflictestinal mucosa and the repair of acute and chronic mucosal estimates, skin disease related to uncontrolled cell growth, e.g. cancer. Conflictestinally, disease related to uncontrolled cell growth, e.g. cancer. PRO polypeptides at herapeutic trargets for anti-tumour druggs, and are also employed therapeutically in vivo for lessening the effects of viral intection. The PRO polypeptides can be also used in assays to determine intection. The PRO polypeptides can be also used in assays to determine intervention of antithrombotic agent with reduced risk for haemorrhage as compared with heapearing other PRO-associated diseases or their reversal, as an antithrombotic agent with reduced risk for haemorrhage as compared with heapearing other PRO-associated diseases or their reversal, as an entithrombotic agent with reduced risk for haemorrhage as compared to generating other and angeled and their portions affect the expression of commertial bleeding angiogenesis, and may also have an effect on kidney to isolate the full-length PRO cDNA or to isolate other cDNAs, in concludation and gene mapping, in the generation of antisense and gene mappi

                                                                                                                                                                                                         ö
          therapeutic agents, for screening compounds to identify those that minic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists) rhe polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                           Human; PCR; primer; ss; PRO; secreted; transmembrane; gastrointestinal mucosa; mucosal lesion; skin disease; skratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's diseases; amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; kidney tissue; apoptosis; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nootropic; neuroprotective; cytostatic; virucide; anticoagulant.
are useful as molecular marker for protein electrophoresis purposes, as

the invention distillation that the polypoptides can be used to raise and the muclat acid encoding them. The polypoptides can be used to raise and the muclate that specifically bind to the PRO polypeptide for linking a bioactive molecule to a cell expressing a PRO polypeptide for inking a conflower that specifically bind to the PRO polypeptide. The PRO polypeptides are useful a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. PRO polypeptide are also useful for reducing disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal estimates, skin diseases associated with abnormal keratinocyte differentiation (e.g. peortasis) Parkinson's disease, amyotrophic lateral sclerosis (ALS), neuropathies and additionally, disease related to uncontrolled call growth, e.g. cancer. Company and the properties as tumour specific antiques which may be exploited as therapeutic lateral sclerosis (ALS), neuropathies and additionally disease related to uncontrolled call growth, e.g. cancer. Company at the PRO polypeptides can be also used in assays to determine infection. The PRO polypeptides can be also used in assays to determine infection. The PRO polypeptides can be also used in assays to determine infection. The PRO polypeptides can be also used in assays to determine infection. The PRO polypeptides can be also used in acreased of company of the properties as tumour specific antithrombotic agant with reduced risk for haemorrhage as compared with here a role in apportoins. The polymeticetical sclenar which have a role in apportoins. The polymeticetical and proteins are useful and may also have an effect on kindle concentary briefly and protein and for chromosome and gene mapping, in the generation of antisense RNA and concentary of individual which have a role in apportoines, and protein and concentary of re
                                                                                                                                                                                                                                                                                                                                                                  The invention discloses isolated PRO secreted/transmembrane polypeptides
                                                                                                                                                                                                                       New secreted and transmembrane polypeptides useful for treating skin, neurodegenerative diseases, asthma, rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO

New genes and secreted and transmembrane polypeptides (e.g. PRO245 or PRO1868), useful for treating or diagnosing e.g. cancers, atherosclerosis, infertility, stroke, AIDS or multiple sclerosis in mammals.

Example 33; Page 100; 476pp; English.

The invention relates to an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nuclectide encoding any of 61 PRO (secreted and transmembrane protein) polypeptides appearing as ABO32756-ABO32816, or (b) any of 61 nuclectide sequences having 50-4053bp fully defined in the specification; or the full length coding sequence of polypeptide (lacking its associated signal peptide or an extracellular peptide (lacking its associated signal peptide or an extracellular peptide, a vector comprising the nucleic acid molecule. A host cell comprising the vector (used to produce the PRO polypeptide), a chimaeric acid sequence, an anti-PRO anti-PRO anti-PRO proposed to a heterologous amino acid sequence, an anti-PRO anti-PRO, decerting PRO245 or PRO1868 polypeptide in a sample suspected of containing any of these PRO polypeptides, linking a bioactive molecule to a cell expressing a PRO245

```
or PRO1868 polypeptide and modulating at least one biological activity of a cell expressing the PRO245 or PRO1868 polypeptide. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for diagnostics, biosensors or bioreactors. These are particularly useful for diagnostics, biosensors e.g. inflammations, rheumatoid arthritis, psoriasis, multiple sclerosis, atherosclerosis, infertility, birth defects, premature aging, malignancy (e.g. cancers), strokes, heart attacks, hypertension, gastrointestinal ulcerations, Parkinson's diseases, Alzheimer's disease, or AIDS in mammals. These are also useful for modulating cholesterol uptake in the cody, and in wound healing or tissue repair. The PRO polypeptides are useful in drug screening. The PRO polypeptides are also useful as hybridisation probes, or for screening libraries of human contains the replacing a defective gene. The present charapy, particularly for replacing a defective gene. The present sequence is an oligonucleotide (PCR primer or probe) used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; PRO; primer; ss; secreted polypeptide; transmembrane polypeptide; abnormal bleeding; gynaecological disease; hysterectomy; mucosal lesion; coronary ischaemic condition; gastrointestinal mucosa; skin disease; ALS; keratinocyte differentiation; psortiasis; Parkinson's disease; asthma; Alzhaimer's disease; rheumatoid arthritis; multiple sclerosis; cancer; amyotrophic lateral sclerosis; neuropathy; uncontrolled cell growth; PCR.

```
The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polynucleotides encoding them. The PRO polypucleotides and be used in diagnosing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for hysterectomy. They can also be used in treating coronary ischaemic conditions, disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis), Parkinson's disease, Alzaheimer's disease, asthma, rheumatoid arthritis, multiple sclerosis, amyotrophic lateral sclerosis (ALS), neuropathies and diseases related to uncontrolled cell growth, such as cancer. This sequence represents a PCR primer used to isolate a human PRO polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tissue typing; immunohistochemical staining; gene therapy; neonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fcs; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinaulinaemia; hypoinsulinaemia; hypoinsulinaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.
                                                                                                                                                                                   Novel secreted and transmembrane PRO polypeptides and polynucleotides encoding them, useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

(GETH) GENENTECH INC.

Botstein D, Desnoyers L, Eaton DL, Ferrara N, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A, Grimaldi JC, Allavin IJ; Pan J, Paoni NF, Roy MA, Stewart TA, Tumas D; Ashkenazi A, Botstein D, Filvaroff E, Fong S, Gao Godowski PJ, Grimaldi JC, Williams PM, Wood WI; Pan J Mather JP,

WPI; 2003-521801/49.

New genes encoding for secreted and transmembrane PRO polypeptides, useful for treating e.g. cardiac insufficiency disorders, wounds, cancers, obesity, diabetes, hyperinsulinemia, hypoinsulinemia, or arthritis.

Example 33; SEQ ID NO 204; 476pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucloid scid encoding them. The polypeptides contributing a cartibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a call expressing a PRO polypeptide, for linking a bioactive molecule to a call expressing a PRO polypeptides. The PRO polypeptides are useful cortive and productive modelcule to a call expressing a PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a call expressing a PRO polypeptides or polymental activity of polypeptide artibodies are useful as pharaccuticals, diagnostics biosensors or polymucleotides are useful as pharaccuticals, diagnostics biosensors or polymucleotides are useful as pharaccuticals, diagnostics biosensors or polymucleotides are useful for stimulating hypertrophy of monatal heart, inhibiting vascular endothelial cells, modulating proliferation of for proliferation of chondrocytes, enhancing the proliferation of control for etinal neurons or rod photoreceptor cells, inducing c-fos in endothelial cells, modulating glucose or PRA uptake, inducing proliferation of chondrocytes, enhancing the proliferation of chondrocytes, enhancing the proliferation of chondrocytes, enhancing cells, modulating processor or practiles to be proportially due to cretinal incurrences or practiles of the proportial city and the control of the proportial city of the proportial city of the proportial city of the proportial city of the proportial city of solate the full-length PRO cDNA or to isolate other control of solate control of control of solate the full-length PRO cDNA, in chromosome and gene mapping, in the generation of antisense RNA are useful in molecular biology including use as hybridiatation process of creening combinantly expressing the protein and for chromosome and gene mapping, in the generation of genetic analysis of individuals with genetic disorders as well for the propertied canagonic and propertied analysis of indiv

Novel PRO polypeptides useful for treating Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2003-755054/71.
  ö
PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                  Human; PCR; primer; ss; PRO; secreted; transmembrane; gastrointestinal mucosal lesion; skin disease; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's diseases; amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; kidney tissue; apoptosis; therapeutic; tissue typing; immunobistochemical staining; sene therapy; nootropic; neuroprotective; cytostatic; virucide; anticoagulant.

Alzheimer's disease, enterocolitis, Zollinger-Ellison syndrome, psoriasis, epidermoid carcinoma of the vulva and gliomas, gynecological diseases

Example 33; SEQ ID NO 204; 479pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides can define muclate acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a thiodites that specifically bind to the PRO polypeptide, for linking at least one biological activity of a cell. PRO polypeptide are useful for determine the properties are useful controlled activity of a cell. PRO polypeptide are useful for determine the properties are useful controlled and the repeat of activity of a cell expressing a PRO polypeptide and antichance of gastrointesinal mucosa and the repair of actual model in again with the area actual actual mucosa and the properties, and may also have an effect on kidner of antisens RNA and DNA, for prepairing PRO polypeptides and thair portions affect the actual mucosa and actual mucosa and for the generation of antisens RNA and DNA, for prepairing PRO polypeptides and may also have an effect of the formation of genes which have a role in apoptodis. The polymucleotides are useful in chargentically useful acagenesis, and may also have an effect of the formation of contentions are useful in the development and accordance and generation of antisens RNA and mucosa are useful as molecular mar

The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are used for treating diseases related to growth or survival of nerve cells such as Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS) and neuropathies, diseases related to uncontrolled cell growth such as cancer, viral infections, Usher's syndrome, paemorrhage, enterocolitis, Calinger-Ellison syndrome, gastrointestinal ulceration, congenital microvillus atrophy, skin diseases such as psoriasis and epithelial cancers, endometrial bleeding, angiogenesis, ischaemic conditions, asthma, rheumatoid arthritis, multiple sclerosis, inclammatory diseases, atherosclerosis, cardiac injury, infertility, birth defects, premature eqing, ALDS, stroke and diabetic complications. The polymucleotides are also useful in chromosome and gene mapping. This sequence represents a per primer used in isolation of a human PRO polymucleotide of the

New secreted and transmembrane PRO polypeptides e.g. PRO187, which is a member of the epidermal growth factor-8 (EGF-8) family of proteins, useful for treating cancer.

Example 33; SEQ ID NO 204; 471pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modularing

c for detecting other PRO polypeptides in a sample and for linking a bioach can bological activity of a cell expressing a PRO polypeptides. The PRO polypeptides are also bioacical activity of a cell expressing a PRO polypeptides. The PRO polypeptides are also bioacical activity of a cell expressing PRO polypeptides. PRO polypeptides are also useful computation that are also useful computed by the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal diseases, amyotrophic lateral sclerosis (ALS), neuropathies and additionally disease related to uncontrolled cell growth, e.g. cancer. Rev polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also exploited as therapeutic diseases as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also exploited as therapeutic diseases or their reversal, as an antithrombotic agent with reduced risk for haemorrhage as compared with hepatin, in treating other PRO-associated disorders, in modulating capture. PRO polypeptides and their portions affect the expression of candometrial bleeding angiogenesis, and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of candometrial bleeding angiogenesis, and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of connecting PRO polypeptides and their portions affect the expression of the commonwer and gene mapping, in the generating transgenic animals of therapeutically useful reagents, as probes and for the generatic analysis of therapeutically useful reagents, as probes and for the generatic analysis of therapeutically useful reagents, as probes and for the generatic analysis of individuals which are useful in the generating transgenic analysis of therapeutically useful reagents, or prevent the effect of the PRO polypeptide (agonists) or prevent the reference typing PRO anti ö one biological activity of a cell. PRO polypeptides are useful recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO Gaps . 0 66.2%; Score 17.2; DB 9; Length 24; 86.4%; Pred. New secreted and transmembrane PRO polypeptides, useful for treating cancer, skin disorders, neurodegenerative diseases, and for lessening the effects of viral infection.

Example 33; SEQ ID NO 204; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides can be used to raise catical that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for inking a unicative molecule to a cell expressing a PRO polypeptides are useful for of acell expressing a PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal ferentiation (e.g. psoriated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal diseases, amyotrophic lateral sclerosis (ALS), neuropathies and diseases, amyotrophic lateral sclerosis (ALS), neuropathies and diseases, amyotrophic lateral sclerosis (ALS), neuropathies and calso diseases, amyotrophic lateral sclerosis (ALS), neuropathies and cancer. PRO polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also capped the preparin, in treating other PRO-associated disorders, in modulating antifection. The PRO polypeptides can be also used in assays to determine if it has a role in neurodegenerative diseases or their reversal, as an antifection. The PRO polypeptides and their portions affect the expression of engenes which have a role in apoptosis. The polymuclectices in modulating enes and their portions affect the expression of to solate the full-length PRO colypeptides, and may also have an effect on Nidney to solate the full-length PRO polypeptides, and may also have an effect on the commence and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, or generating transgenic animals which are useful in the d

                                                                                                                                                                                                                                                                                                                     21-NOV-
                                                                                                                                                                                                                                                                                                                                                                        24 -NOV - .
                                                                                                                                                                                                                                                                                                                                                                                                             25-NOV-
         therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for recombinantly expressing the protein and for chromosome identification. The proteins are useful as molecular marker for protein electrophoresis purposes, as the PRO polypeptide (agonists) or prevent the effect of the PRO colypeptide (antagonists) or prevent the effect of the PRO colypeptide (antagonists) or prevent the effect of the PRO colypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful contissue typing. PRO antibodies are useful contissue typing. PRO antibodies are useful contissue typing and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO eg detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; PCR; primer; ss; PRO; secreted; transmembrane; gastrointestinal mucosa; mucosal lesion; skin disease; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's diseases; amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; kidney tissue; apoptosis; therapeutic; tissue typing; immunobistochemical staining; gene therapy; nootropic; neuroprotective; cytostatic; virucide; anticoagulant.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nutcleic acid encoding then. The polypeptides can be used to raise antichedies that specifically bind to the PRO polypeptide; for linking a carichedies that specifically bind to the PRO polypeptide. The PRO polypeptide antibodies are useful for a cell expressing a PRO polypeptide are useful for detecting other PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptide are as also useful for detecting other PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. PRO polypeptide are also includes in an expension of gastrointestinal mucosa and the repair of gastrointestinal mucosa and the repair of seasons, skin diseases associated with the preservation and maintenance of gastrointestinal mucosa and the repair of seasons, skin diseases related to uncontroiled call growth. e.g. cencer. Gifferentiation (e.g. psoriasis), Parkinson's disease, anyotrophic lateral sclerosis (ALS), neuropathies and call tental sclerosis (ALS), neuropathies and call the properties are called to uncontrolled call growth. e.g. cencer. PRO polypeptides also serves as turniturolled call growth. e.g. cencer. PRO polypeptides can be also used in assays to determine infection. The PRO polypeptides can be also used in assays to determine controlled as role in neurodegenerative diseases or their reversal, as an antitrombotic agent with reduced risk for haemorrhage as compared with here a role in apoptosis. The polymuclectides are useful in apoptosis and presented disorders, in mucoderial percent with the development and screening of crissue. PRO polypeptides and their portions affect the expression of content of the proporties are useful in the development and screening of content and serversal, and the percent and serversal and proteins are useful in the respective (againsts). The polymuclectides are useful in the PRO polypeptide (againsts). The polymuc New PRO polypeptides useful for treating Parkinson's disease, enterocolitis, Zollinger-Ellison syndrome gastrointestinal ulceration, Alzheimer's disease, amyotrophic lateral sclerosis and Usher syndrome. , Botstein D, Desnoyers L, Eaton DL, Ferrara N; , Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A, , Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; , Paon J, Paoni NF, Roy MA, Stewart TA, Tumas D; , Wood WI; Sequence 24 BP; 7 A; 1 C; 12 G; 4 T; 0 U; 0 Other; Example 33; SEQ ID NO 204; 468pp; English. WPI; 2003-531434/50.

New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO245 or PRO1868, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.

Example 33; SEQ ID NO 204; 475pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides.

```
Correction discusses associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal diseases, anyotrophic lateral sciences; (ALS), neuropathies and diseases, anyotrophic lateral sciences; (ALS), neuropathies and diseases, anyotrophic lateral sciences; (ALS), neuropathies and diseases, anyotrophic lateral sciences; (ALS), neuropathies and acade additionally, disease related to uncontrolled cell growth, e.g. cancer. Pro polypeptides also serves as tumour specific antigens which may be exploited as therapeutic targets for anti-tumour drugs, and are also employed therapeutically in vivo for lessening the effects of viral antifection. The PRO polypeptides can be also used in assays to determine if it has a role in neurodegenerative diseases or their reversal, as an antifection with reating other PRO-associated disorders, in modulating anticophic proportions and may also have an effect on kidney tissue. PRO polypeptides and their portions affect the expression of genes which have a role in apoptosis. The polymucleotides are useful in chromosome and gene mapping, in the generation probes for cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, in chromosome and gene mapping, in the generation of antisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or therapeutically useful reagents, for generating transgenic animals or therapeutically useful reagents, for spreaders as well as for recombinantly are useful as molecular marker for protein electrophoresis purposes, as the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (agonists) or the proteins are useful conting and/or assay of sample fluids. Anti-PRO antibodies are useful in approximated the processing the protein and for chromosome processing the protein or proteins are useful second and processing the protein and effect
treating disorders associated with the preservation and maintenance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotide of the invention.

Novel isolated secreted and transmembrane PRO polypeptide, useful for tissue typing, treating Parkinson's disease, Alzheimer's disease, birth defects, cancer.

Example 33; SEQ ID NO 204; 464pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptides, for linking a broactive molecule to a cell expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a collective molecule to a cell expressing a PRO polypeptides are useful for medulating the biological activity of a cell expressing a PRO polypeptides are also useful cor recently and the properties are also useful activity of a cell expressing which the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal effects of gastrointestinal mucosa associated with the preservation and maintenance of gastrointestinal mucosa associated with the preservation and maintenance of gastrointestinal mucosa associated with the more and chronic mucosal effects of gastrointestinal mucosa associated with abnormal kerationcyte and the repair of acute and chronic mucosal distinguishing the effects of gastrointestinal ly, disease related to uncontrolled cell growth, e.g. cancer. Consolides also serves as tumour specific antigens which may be exploited as therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in assays to determine comployed therapeutically in vivo for lessening the effects of viral candemetrial bleeding anglogenesis. The polymore and comparing of the parin, in treating other PRO-associated disorders, in modulating endomer and gase mapphylay, in the generating orber other connections are useful in a generating transgenic antisens of the full-length PRO polypeptides, for generating transgenic and propertical or construction probes for condemetrically useful reagents as probes and for the generating of the reagentic and so ortering complements of individuals with generic disorders as well as for recom

the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; PRO, primer; 88; secreted polypeptide; transmembrane polypeptide; leukocyte homing; rheumatoid arthritis; psoriasis; multiple sclerosis; mucosal lesion; enterocolitis Zollinger Ellison syndrome; asthma; PCR; antiasthmatic; antirheumatic; antiarthritic; neuroprotective.

     The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The polypeptides are useful for detecting PRO polypeptides and for linking a bioactive molecule to a cell expressing the polypeptides, where the bioactive molecule is a toxin, radiolabel or an antibody. The bioactive molecule is a toxin, radiolabel or an antibody. The bioactive molecule is a toxin, radiolabel or an antibody. The bioactive molecule is a toxin, radiolabel or an antibody. The bioactive polypeptides are useful for modulating at least one biological activity of a cell expressing the polypeptides or antibodies. The biological activity of a cell expressing the polypeptides. The copy polypeptides are useful for modulating and multiple copy as as than a sathma, rheumatoid arthritis, psoriasis and multiple collinger Ellison syndrome and for identifying agonists or antagonists of the polypeptides. The polymucleotides are useful as hybridization probes, in chromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptides and for generating probes for polymerase chain reaction (PCR), Northern analysis, southern analysis and Western analysis. This sequence represents a PCR. primer used in isolation of a human PRO polymucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gastrointestinal mucosa; mucosa lesion; skin disease; keratinocyte differentiation; psoriasis; Parkinson's disease; Alzheimer's disease; amyotrophic lateral sclerosis; ALS; neuropathy; cell growth; cancer; tumour; viral infection; neurodegenerative disease; antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; tidney tissue; appptosis; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nootropic; neuroprotective; cytostatic; virucide; anticoagulant.
                  Novel secreted and transmembrane polypeptide for modulating biological
                               activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

The invention discloses isolated FVO Secreed/Tabmsemprash polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide for including a bloactive molecule to a cell expressing a PRO protein and for modulating a bloactive molecule to a cell expressing a PRO protein and for modulating a bloactive molecule to a cell expressing a PRO protein and for inking a bloactive molecule to a cell expressing a pRO polypeptide. The PRO polypeptide must be considered with abnormal Roral including a consideration of a cell expressing PRO polypeptide and maintenance of a cell expressing PRO polypeptides. PRO polypeptide are also useful for treating disorders associated with abnormal Recratinocyte mucosal eleanors. Sain diseases associated with abnormal Recratinocyte differentiation (e.g. poortiasis), Parkinson's disease, Alzheimer's differentiation (e.g. poortiasis), Parkinson's disease, Alzheimer's differentiation (e.g. poortiasis), Parkinson's disease, Alzheimer's differentiation (e.g. poortiasis), Parkinson's disease, Alzheimer's differentiation (e.g. poortiasis), Parkinson's disease, Alzheimer's disease related to uncontrolled cell growth, e.g. cancer. Celeases, amyorrophic laceral sclerosis (ALS), neuropathies and additionally, disease related to uncontrolled cell growth, e.g. cancer. Ce mployed therapeutically in vivo for lessening the effects of viral infection. The PRO polypeptides can be also used in seasys to determine if it has a role in neurodegenerative diseases or their reversal, as an entithronomic agent with reduced risk for haemorinage are useful in mendomeric agent with reduced risk for haemorinal series of the molecular biology including uses as hybridisation probes for chomosome and gene mapping, in the generating transgenic animals which are useful in the development and screening chromosome and gene mapping, in the generating to prevent the effect of the protein and for chromosome independent and protein electrophoresis purposes, as therapeutically weighted (antagonists) rheadome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated secreted and transmembrane polypeptide, useful for treating diseases, e.g. Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis, cancer, neuropathies, diabetes and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention discloses isolated PRO secreted/transmembrane polypeptides

Novel isolated native PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating enterocolitis, Zollinger-Ellison syndrome

```
The invention discloses isolated PRO secreted/transmembrane polypeptides and the muclate acid encoding them. The polypeptides can be used to raise and the muclate acid encoding them. The polypeptides not be used to raise and the trape and for modulating the biological activity of a cell. PRO polypeptide are useful for modulating at least one biological activity of a cell. PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptides are useful for modulating the biological activity of a cell expressing a PRO polypeptide and maintenance of garcronnessinal mucosa and the repair of activation and maintenance of garcronnessinal mucosa and the repair of activation and maintenance of garcronnessinal mucosa and the repair of acted and all nemance of garcronnessinal mucosa and the repair of acted foronic mucosal lenoms, skin disease related to uncontrolled cell growth, e.g. cancer. RRO polypeptides also serves as tumour specific antigens which may be disease, mayortophic leared sclerosis (ALS), neuropathics and additionally, disease related to uncontrolled cell growth, e.g. cancer. RRO polypeptides also serves as tumour specific antigens which may be employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutic targets for anti-tumour drugs, and are also employed therapeutically in vivo for personal and part with reduced risk for associated disorders as effect the expression of gress which have a role in apoptosis. The polymucleotides are useful in charpentically useful aced in apoptosis, and may also the protein and dor charpentic and disorders as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic;

Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as an antithrombotic agent and for inducing endothelial cell apoptosis. encoding

Example 33; SEQ ID NO 204; 470pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating a confidencial order of a cell expressing a PRO polypeptides are useful for detecting other PRO polypeptides in a sample and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell expressing a PRO polypeptide or cell expressing as paramaceuticals, diagnostics, biosensors or polymedicotides are useful for stimulating the biological activity of polymedicotides are useful for stimulating hypertrophy of neonatal continuity inhibiting vascular endothelial growth factor (VEGP)-stimulated proliferation of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of chondrocytes. In particular, these are useful for efficientiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to the propingulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polynucleotides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          02-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                      07-NOV-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-DEC-1999
                                                                                                                                                                                                                                                                                                                29-0CT-1
           are useful in molecular biology including uses as hybridisation probes
for cDNA library to isolate the full-length PRO cDNA or to isolate other
cDNAS, in chromosome and gene mapping, in the generation of antisense RNA
and DNA, for preparing PRO polypeptides, for generation of antisense RNA
and DNA, for preparing PRO polypeptides, for generation standsgenic
animals or knockout animals which are useful in the development and
screening of therapeutically useful reagents, as probes and for the
screening of therapeutically useful reagents, as probes and for the
screening of therapeutically useful reagents, as probes and for the
screening of therapeutically useful reagents, as probes and for the
screening of therapeutically with genetic disorders as well as for
recombinantly expressing the protein and for chromosome identification.
The proteins are useful as molecular marker for protein electrophoreais
those that mimic the PRO polypeptide (agonists) or prevent the effect of
the PRO polypeptide (antagonists). The polymucleotides and proteins are
useful for tissue typing. PRO antibodies are useful for
immunohistochemical staining and/or assay of sample fluids. Anti-PRO
antibodies are useful in diagnostic assays for PRO e.g. detecting its
expression in specific cells, tissues or serum and for affinity
complexed of PRO from recombinant cell culture or natural sources. The
PRO genes may also be used in gene therapy, particularly for replacing a
defective gene. The sequence presented is a PCR primer which was used to
amplify a PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; tosonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; stimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FFA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinsulinaemia; hypoinsulinaemia; hom disorder; cartiage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

                                       The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide. For linking a cariotative for a cell expressing a PRO polypeptide. The PRO polypeptide are useful for detecting other PRO polypeptides. The PRO polypeptides are useful for modulating the biological activity of a cell. PRO polypeptides or the PRO polypeptides or the PRO polypeptides or the PRO polypeptides or polymorpetide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polymorlectides are useful for modulating the proliferation of a cell expressing PRO polypeptides. The PRO polypeptides or polymorlectides are useful for stimulating hypertrophy of mennaral control profile antibodical activity of a cell spreasting PRO polypeptides. The PRO polypeptides or polymorlectides are useful for stimulated or lymphocytes, enhancing the survival or proliferation of endothelial cells, modulating uppoliferation addition or red phocyces, inducing proliferation of chondrocytes. In particular, these are useful for cells, modulating glucose or FPO uppea. Inducing proliferation of chondrocytes or injuries (e.g. loss of sight due to capture to the properties or injuries (e.g. loss of sight due to control properties or injuries (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the arthritis on mammals. PRO polypeptides and their portions affect the crown properties or injuries (e.g. sports injuries or survival information of genes which have a role in cell death. The properties or injuries (e.g. sports injuries or the combinant problem and provides are useful in molecular bology including uses as hybridisation probes are useful in molecular bology including uses as hybridisation of genetic analysis of individuals with genetic also benefil and genetic assays for PRO expension in specific cells, insurance or serve and 
                                                                                                                                                                                                          Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as an antithrombotic agent and for inducing endothelial cell apoptosis.

as an Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, antithrombotic agent and for inducing endothelial cell apoptosis.

Example 33; SEQ ID NO 204; 473pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a cell expressing a PRO protein and for modularing

cc at least one biological activity of a cell. PRO polypeptides are useful for inhiting a bloadtive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide the PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or for ell expressing PRO polypeptides. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or provide actors. These are useful as pharmaceuticals, diagnostics, biosensors or provideration of endothelial cells, modulating hyperprises or provideration of endothelial cells, inducing proliferation of criminal neurons or rod photoreceptor cells, inducing proliferation of diafferentiation of chondrocytes. In particular, these are useful for cells, modulating glucose or FRA upgake, inducing proliferation of diafferentiation of chondrocytes. In particular, these are useful for differentiation of chondrocytes. In particular, these are useful for cells, modulating glucose or FRA upgake, inducing proliferation of thomerows. The properties of the survival or proliferation of chondrocytes. In particular, these are useful for cells, inducing proliferation of chosen or carrilage discorders (e.g. sports injuries or thomeromal or properties and their portions affect the are useful in molecular biology including uses as hybridisation probes or corribinal properties and their portions and corrections are useful as molecular biology including uses as hybridisation probes or comminal or knockout animals which have a useful as probes and for the general properties of animals which are useful as properties and proteins are useful as molecular marker for protein electrophoresis or proteins of therapeutically useful respented search general proteins are useful as molecular marker for protein electrophoresis or purposes as therapeutical general with generic discomplication or protein are useful and diagnostic assays defective gene. The sequence presented is a PCI amplify a PRO polynucleotide of the invention.

Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.

Example 33; SEQ ID NO 204; 476pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antitodies that specifically bind to the PRO polypeptide, for linking a bloactive molecule to a call expressing a PRO protein and for modulating at the state of the protein and for modulating at loadctive molecule to a call expressing a PRO polypeptides are useful controlled to a call expressing a PRO polypeptides are useful for modulating the biological activity of a call expressing a PRO polypeptides. The PRO polypeptide antibodies are useful for modulating the biological activity of a call expressing a PRO polypeptides. The PRO polypeptides or activity of polymethed antibodies are useful for modulating the biological activity of polymethed antibodies are useful for stimulating hypertrophy of meonatal protectors. These are useful for stimulating hypertrophy of meonatal confideration of endothelial calls, modulating hypertrophy of retinulated T-lymphocytes, enhancing the survival or proliferation of formatorytes, enhancing the survival or proliferation and/or retinal meurons or rod photoreceptor calls, inducing proliferation and/or reciples, modulating glucose or PPA uptake, inducing proliferation and/or detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to detecting or treating cardiac insufficiency disorders, wounds, cancerous continities pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in call death. The polymucleotides are useful in molecular biology including uses as hybridisation probes of conda DNA, for preparing PRO polypeptides, for generating of therapeutically useful reagents, as probes and for the generation. Condannessing the protein and for chromosome and gene mapping, in the generation of antisense RNA a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20-DEC-1999
       ö
The proteins are useful as molecular marker for protein electrophoresis purposes, as therapeutic agents for screening compounds to identify those that mimic the RNO polypepide (agonists) or prevent the effect of the PRO polypepide (antagonists). The polymucleotides and proteins are useful for tissue typing. PRO antibodies are useful for assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity butification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                   Human; PCR; primer; ss; PRO; secreted; transmembrane; therapeutic; tissue typing; immunohistochemical staining; gene therapy; neonatal heart; vascular endothelial growth factor; VEGF; proliferation; endothelial cell; atimulated T-lymphocyte; retinal neuron; rod photoreceptor cell; c-fos; glucose; FRA; chondrocyte; cardiac insufficiency disorder; wound; cancer; tumour; retinal disorder; retinitis pigmentosum; obesity; diabete; hyperinsulinaemia; hypoinsulinaemia; bone disorder; cartilage disorder; sport injury; arthritis; cardiant; vulnerary; cytostatic; ophthalmological; osteopathic; antiarthritic; anorectic.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide. For Illuting a carbodies that specifically bind to the PRO polypeptide. The PRO polypeptide are useful for a cell sepressing a PRO polypeptide. The PRO polypeptide are useful for modulating the biological activity of a cell. PRO polypeptides are useful for modulating the biological activity of polypeptide antibodies are useful for seimulating hypertrophy of neonatal control of a cell expressing PRO polypeptides. The PRO polypeptides or polymuclectides are useful for seimulating hypertrophy of neonatal carbon of a cell expressing PRO polypeptides. The PRO polypeptides or polymuclectides are useful for seimulating hypertrophy of neonatal carbon of endothelial cells, modulating the proliferation of polymuclectides are useful for seimulated properties. The propertrophy of neonatal carbon of a cell seimulated properties are useful in modulating glucose or FRP uptake, inducing proliferation of chondrocytes. In particular, these are useful for cells, modulating glucose or FRP uptake, inducing proliferation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disperent, and or red phorocytes. The particular, these are useful for certains in particular, these are useful in molecular bology including uses as hybridisation probes tumours, retinal disorders or injuries (e.g. loss of sight due to the consonal results and prolifers and their portions affect the are useful in molecular bology including uses as hybridisation probes are useful in molecular bology including uses as hybridisation properties or only the protein and so recombinantly expressing the protein and for chromosome and gene mapping, in the generation of antimals or knockout animals which are useful in diagnosic assetules are useful in diag

                                                                                                                                                                                                                                                                                                       17-SEP-1997
                                                                                                                                                                                                                                                                                                                                         17-SEP-1997
                                                                                                                                                                                                                                                                                                                                                             SEP-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NOV-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    24-NOV-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -0CT-1
```

```
The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO potypeptide, for linking at least one biological activity of a cell. PRO polypeptides are useful for detecting other PRO polypeptides and for linking a bioactive molecule to a cell expressing a PRO polypeptide. The PRO polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides are useful for modulating the biological activity of a cell expressing PRO polypeptides or bolypeptides or bioreactors. These are useful for stimulating hypertrophy of neonatcal heart, inhibiting vascular endothelial growth factor (VEGF)-stimulated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated PRO polypeptides e.g. PRO234 (useful for treating rheumatoid arthritis, psoriasis and multiple sclerosis) and PRO187 (useful for treating Alzheimer's disease, cancer).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fong S, Gao W, Gerber H, Gerritsen ME, Goddard

proliferation of endothelial cells, modulating the proliferation of stimulated T-lymphocytes, enhancing the survival or proliferation of cretinal neurons or rod photoreceptor cells, inducing c-fos in endothelial cells, modulating glucose or FFA uptake, inducing proliferation and/or redifferentiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to cretinitis pigmentosum), obesity, diabetes, hyperinsulinaemia, or bone or cartilage disorders (e.g. sports injuries or arthritis) in mammals. PRO polypeptides and their portions affect the expression of genes which have a rolle in cell death. The polymicleotides are useful in molecular biology including uses as hybridisation probes of are useful in molecular biology including uses as hybridisation probes of or cDNA library to isolate the full-length PRO cDNA or to isolate other consens and gene mapping, in the generating transgenic and DNA, in chromosome and gene mapping, in the generating transgenic and DNA, for preparing PRO polypeptides, for generating transgenic conformantly expressing the protein are useful in the development and screening of therapeutically useful reagents, as probes and for the genetic analysis of individuals with genetic disorders as well as for those that mimic the PRO polypeptide (angenists). The polymucleotides and proteins are useful for tissue typing PRO antibodies are useful for tissue typing PRO antibodies are useful for insuential reagens or serum and for affinity conserment and secreting its expression in specific cells, tissues or serum and for affinity of propose or popurationally entered in deagnostic and case and an area and an area of the propose and an area of the propose and propose and in dense the remained in diagnostic assay of sample floor recondinant or proving and an area of the propose and an area of the propose and in gene in specific cells, transverse or an artical sources. The 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to

Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating skin, neurodegenerative diseases, as an antithrombotic agent and for inducing endothelial cell apoptosis.

Example 33; SEQ ID NO 204; 470pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides and the mucled acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptide are useful as beauting a bioactive molecule to a cell expressing a PRO polypeptides are useful corrected and acidity of a cell. PRO polypeptides are useful corrected and beautiful as parametericals, diagnostics, biosensors or polypeptide antibodies are useful for modulating the biological activity of a cell expressing PRO polypeptides. The PRO polypeptides or polypeptides are useful as pharmaceuticals, diagnostics, biosensors or polyucalcotides are useful as pharmaceuticals, diagnostics, biosensors or polyucalcotides are useful for stimulating the proliferation of endothelial cells, inducing proliferation of proliferation of endothelial cells, inducing proliferation of cells, modulating diagnostics. In particular, these are useful for retinal neurons or rod phocroceptor cells, inducing proliferation and/or refiferentiation of chondrocytes. In particular, these are useful for detecting or treating cardiac insufficiency disorders, wounds, cancerous tumours, retinal disorders or injuries (e.g. loss of sight due to rethints pignentosum), obesity, diabetes, hyperinaliania, in mammals are bone or cartilage disorders (e.g. sports injuries or rethints pignentosum), obesity, diabetes, hyperinaliania, in mammals. PRO polypeptides and their portions affect the expression of genes which have a role in cell death. The polyuncleotides are useful in molecular biology including uses as hybridisation of entisense RNA and DNA, for preparing PRO polypeptides, for generating transgenic animals or knockout animals which have a role in cell death. The polyment and screening of therapeutic apents, is proper and processing the protein and for themosome identification. The proteins are useful in diagnostic assays for proper an minitarial and proteins are useful in

```
purification of PRO from recombinant cell culture or natural sources. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequence presented is a PCR primer which was used to amplify a PRO polynucleotide of the invention.

```
0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophorasis. Vector DNA was prepared from a derivative of pwM92 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll Xi10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mus musculus (house mouse)

Insert Length: 10000 Std Error: 0.00

Plate: 0079 row: M column: 16

Seq primer: CACACAGGAAACAGCTATGACC

Class: plasmid ends

High quality sequence stop: 27.

High quality sequence stop: 27.
was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4732.114 [gb] AR12.9072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to damptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17 bp DNA linear GSS 29-SEP-2000 LM0079MIGR Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0079MIG R, genomic survey sequence.

o.005 inch orifice at constant by lepeacu passage unlough a was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwM92 (gi|4732114|gb|AF129072.1) a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerses and T4 polymurcleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pWMD42 (gil4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-GOld (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AZ479840 36 bp DNA linear GSS 04-OCT-2000 1M0300P16R Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0300P16 R, genomic survey sequence.

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymurcleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-GG1d (Stratagene) cells and selected for ampicillin resistance."

COMMENT

```
was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWMD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerses and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWMD42 (gil4732114 gbl AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-GGld (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT 84112, USA

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified, The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    **SM Mus musculus

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymerase and T4 polymerase and T4 polymuclectide kinase. Adaptor oligomuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil49132114 gpl AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XII0-Gold (Stratagene) cells and selected for ampicillin resistance."

```
musculus C57BL/61 (male) was obtained from the Jackson Laboratory Mouse DNA Resource (from the Jackson Laboratory Mouse DNA Resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was but end repaired with T4 DNA polymerses and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

//note="Vector: pBluescript II XR; Site 1: EcoRI; Site 2:
Xhof; This cDNA library was constructed from mRNA isolated
from mature flowers of field grown plants. The cDNA
library was prepared using the Stratagene pBluescript II
XR cDNA library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a poly
(dT) sequence with a XhoI restriction site. EcoRI adapters
were ligated to the blunt-ended cDNA fragments followed by
XhoI digestion. The cDNA fragments were directionally
cloned into the EcoRI-XhoI restriction site of the
pBluescript vector. The ligated cDNA fragments were
transformed into XLIO-Gold host cells. This library was
constructed by Dr. Randy Shoemaker and Dr. John

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch oritice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4732114 |gb| AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pMD42 (gi|472114|gla) [All 19.5] a copy-number inducible derivative of plasmid R1. The vector was ligated

/note="Weetor: PWD4Znv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources
/nttp://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.05 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonicleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114 gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XLI0-Gold (Stratagene) cells and selected for ampicillin resistance."

The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of punda (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated

Laboratory Mouse DNA Resource
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.05 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XII0-Gold (Stratagene) cells
and selected for ampicillin resistance."

```
(http://www.nduer.DNA kesources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwM92 (gilfa732114 [gb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chamically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

/ Clone lib. Mouse loke plasmid UGCIM library
/ Inote= Weetcr: PWD4Zuv; Purified genomic DNA from
Musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarcse gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gil 4732114 [gp] AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent B. coli XII0-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (http://www.jav.corg/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pw042 (gi|473114|49|ATL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated

Pools of cells were isolated from a GenomeScreen(TM) library. The
library of cells was generated by retroviral integration of a gene
tagging element consisting of: 1) A promoterless beta-lactamase
proceeded by a splice acceptor as a reporter for gene expression;
2) A promoter driving neomytoin resistance followed by a splice
donor to trap downstream exons. 3' RACE from neomytin gene was
performed using total RNA from isolated pools. Output was shotgun
cloned in pAmp-1 and used to transform DH5-alpha competent
by splice donor from the trapping construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

39 bp mRNA linear EST 11-AUG-2004 AT794161 Antirrhinum majus cDNA clone 018 3 04 h20, mRNA sequence. AJ794161. GI:51109489
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inductible Colored was obtained from the backson inductible to was been constanted by the peaced by the board by a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared but was blunt end-repaired with T4 bNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwm92 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XI10-Gold (Stratagene) cells and selected for ampicillin resistance."
